

Atlantic bluefish short-term projection scenarios from the 2023 Management Track Assessment

OFL CV= 100%

Short term projection of total fishery catch and spawning stock biomass (SSB: with 90% CI) for Atlantic Bluefish based on a harvest scenario assuming annual ABC values calculated from Frebuild (0.183) and the MAFMC risk policy (OFL CV = 100%) between 2024 and 2025. Bridge year removals were assumed to be equal to the previously established ABC value of 13,890 MT (grey cells).
