

Butterfish (*Peprilus triacanthus*) Data Update

Charles F. Adams
Northeast Fisheries Science Center
National Marine Fisheries Service
Woods Hole, MA 02543
March 1, 2016

This document addresses the request by Dr. Christopher Moore, Executive Director of the Mid-Atlantic Fisheries Management Council (MAFMC), in his letter to Dr. William Karp, Northeast Fisheries Science Center (NEFSC) on 20 January 2016. Specifically, the MAFMC requested that the NEFSC provide the following data updates for butterfish:

- Updated catch, landings and discards (in relation to the quota and by geographical location over time)
- Updated survey indices and length composition from the NEFSC trawl surveys
- Trends in mean size in the NEFSC trawl surveys

Catch

Butterfish landings averaged 576 mt from 2002 to 2012 (Table 1, Figure 1). Following the re-establishment of a directed fishery for butterfish in January 2013, landings increased to 1,081 mt in 2013 and 3,135 mt in 2014, but then decreased to 2,131 mt in 2015.

Butterfish discards were highly variable from 2002 to 2012 (Table 1, Figure 1), with a mean and median of 1,480 and 1,079 mt, respectively. CVs during this time period ranged from 0.15 in 2011 to 1.38 in 2003 (Table 2). The discard estimate for 2013 was 444 mt, while the estimate for 2014 increased to 1,144 mt. A discard estimate for 2015 will be available in May 2016.

Total catch was also highly variable during the period 2002 to 2012 (Table 1, Figure 1), with a mean and median of 2,056 and 1,679 mt, respectively (Table 1, Figure 1). Total catch for 2014 was above both these values. The CV associated with this catch estimate was 0.05, the lowest in the time series (Table 2). A catch estimate for 2015 will be available in May 2016.

The following distribution maps for butterfish are contained in the Appendix: commercial landings 2005–2009 (Figure A1) and 2010–2014 (Figure A2); observed discards 2005–2009 (Figure A3) and 2010–2014 (Figure A4); and VTR landings in 2015 (Figure A5).

Survey indices

The NEFSC fall offshore strata (Figure 2) defined in the most recent butterfish stock assessment (NEFSC 2014) were used to calculate the survey indices. Stratified mean number per tow averaged 182.9 during 1989–2015 (Table 3, Figure 3). The 2015 abundance value (290.9) was the fourth largest value in the time series. The CV associated with the 2015 abundance index was 0.30.

Stratified mean weight per tow averaged 5.3 kg over the course of the time series (Table 3, Figure 3). The 2015 value (9.0) was above this average. The CV associated with the 2015 biomass index was 0.23.

Butterfish lengths ranged from 1 cm to 22 cm over the period 1989–2015 (Table 4). Length compositions varied over the course of the time series, with years exhibiting unimodal distributions, and other years exhibiting bimodal or trimodal distributions (Figure 4).

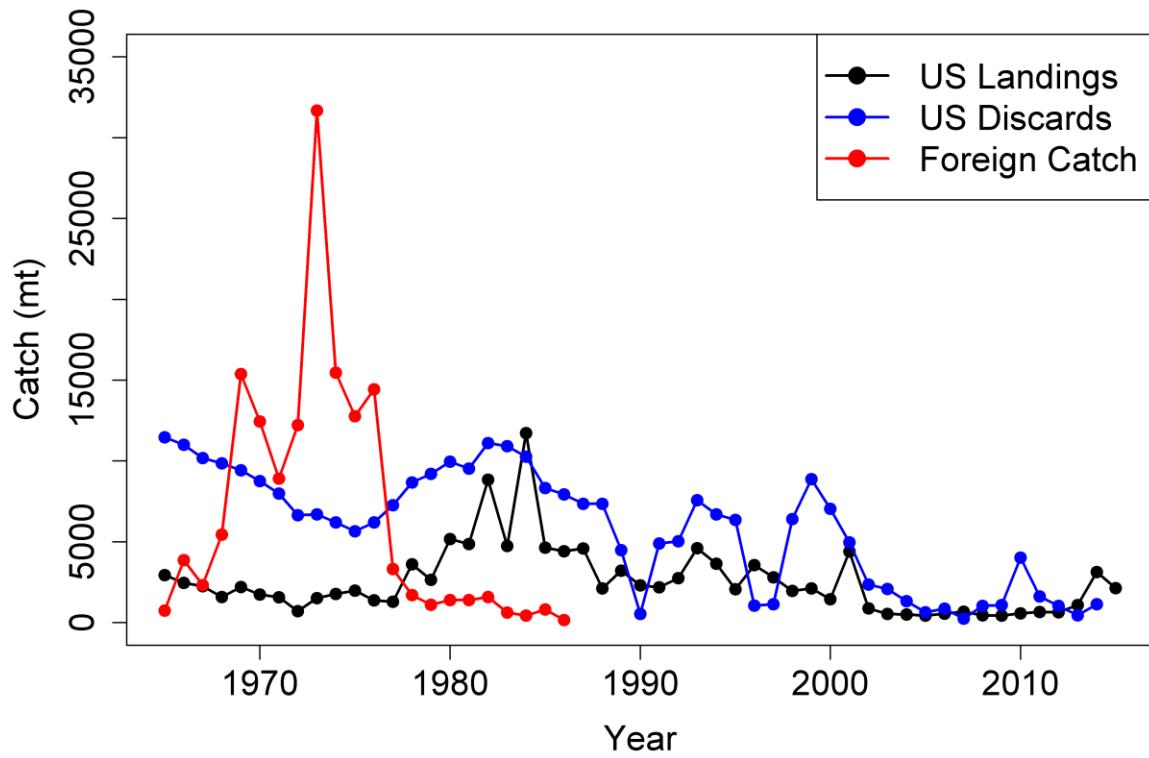

Figure 1. US landings, US discards, and foreign catch of butterfish, 1965–2015.

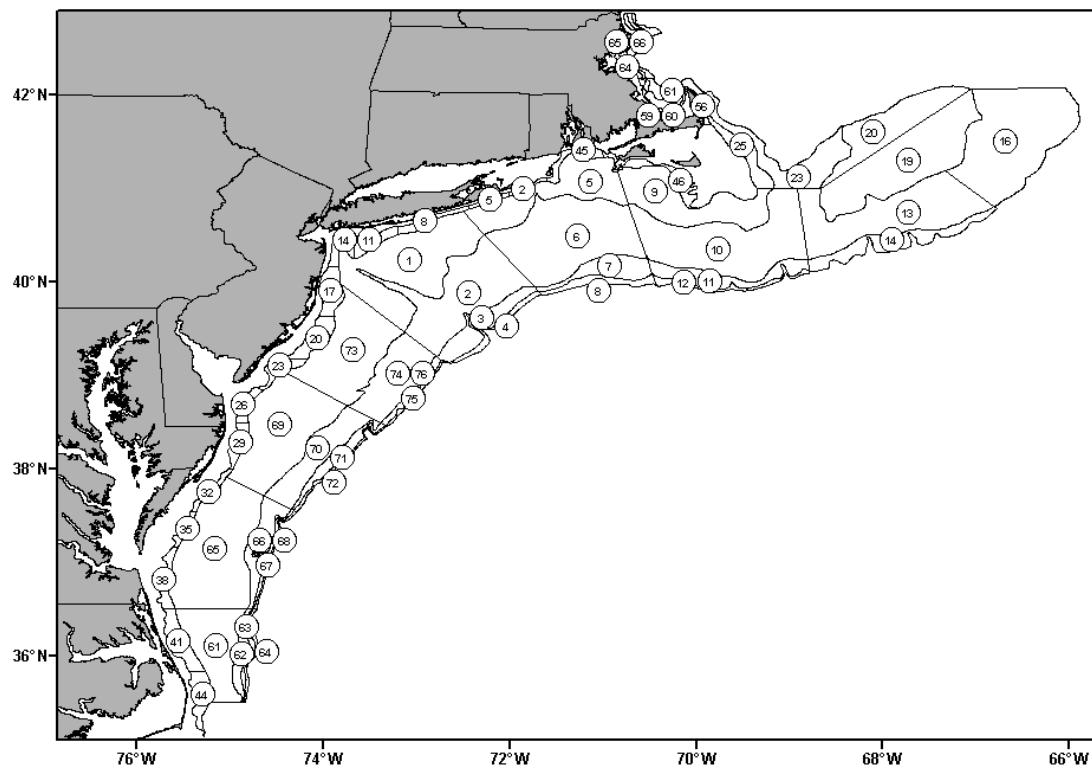

Figure 2. NEFSC strata defined in the most recent butterfish stock assessment (NEFSC 2014) as offshore. Strata include the outermost inshore strata (2, 5, 8, 11, 14, 17, 20, 23, 26, 29, 32, 35, 38, 41, 44–46, 56, 59–61 and 64–66) and offshore strata (1–14, 16, 19, 20, 23, 25 and 61–76).

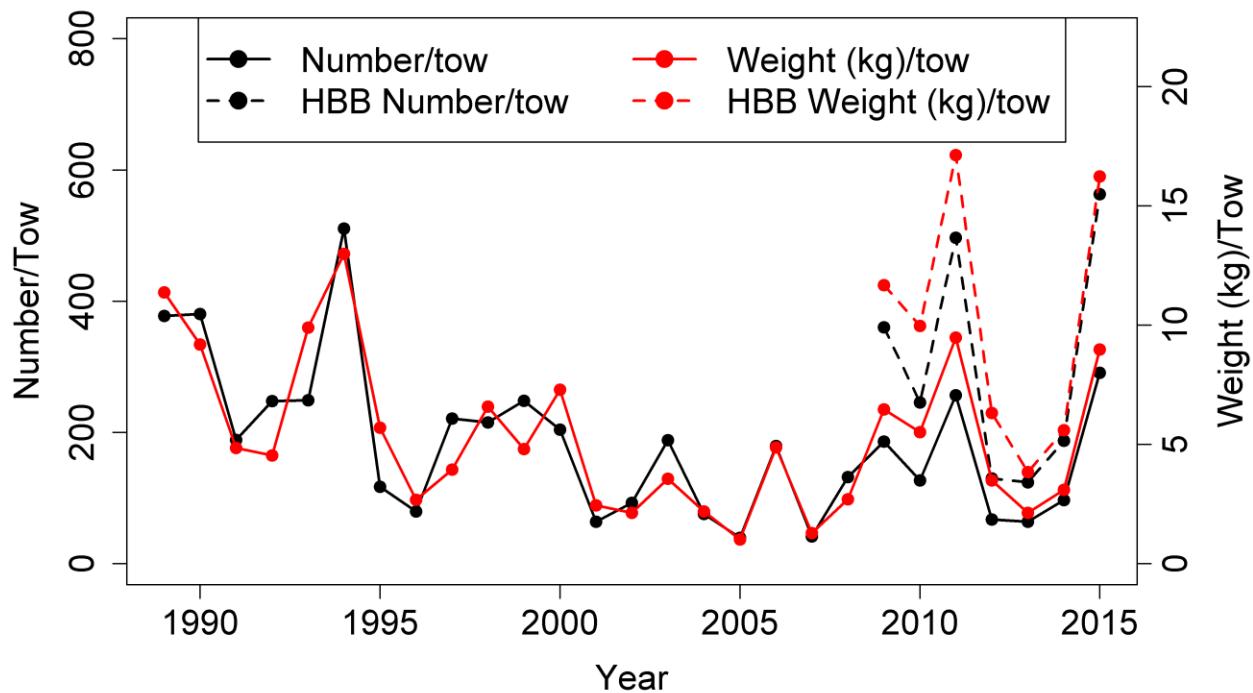

Figure 3. NEFSC fall offshore survey stratified mean number per tow and mean weight per tow for butterfish. Un-calibrated Bigelow (HBB) data (2009–2015) are also shown.

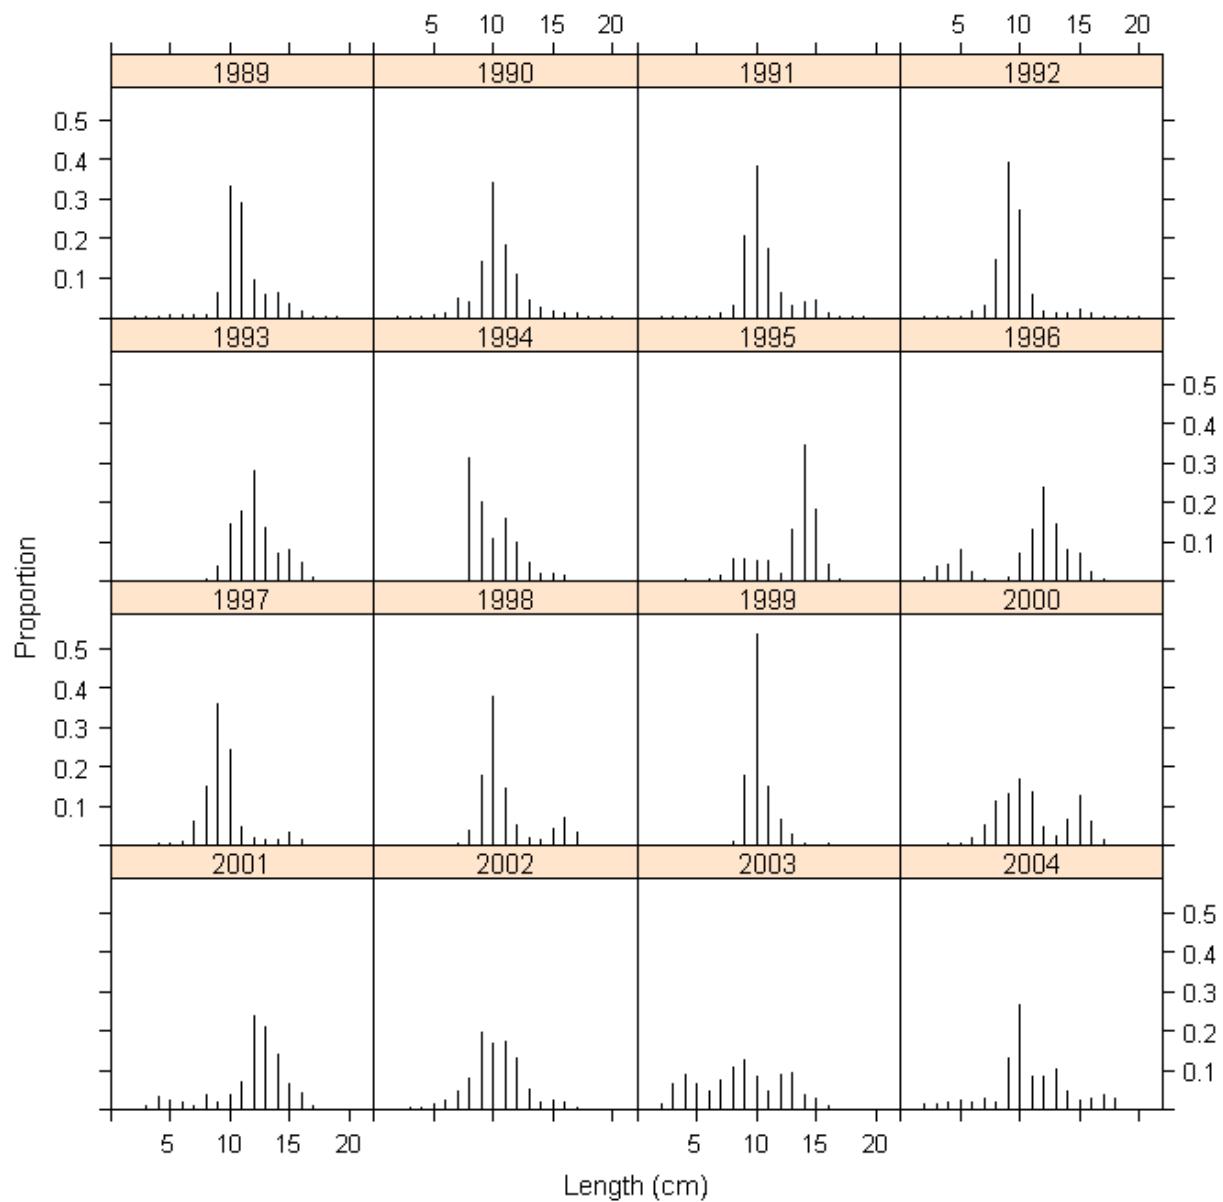

Figure 4. Butterfish length composition from NEFSC fall surveys, 1989–2015.

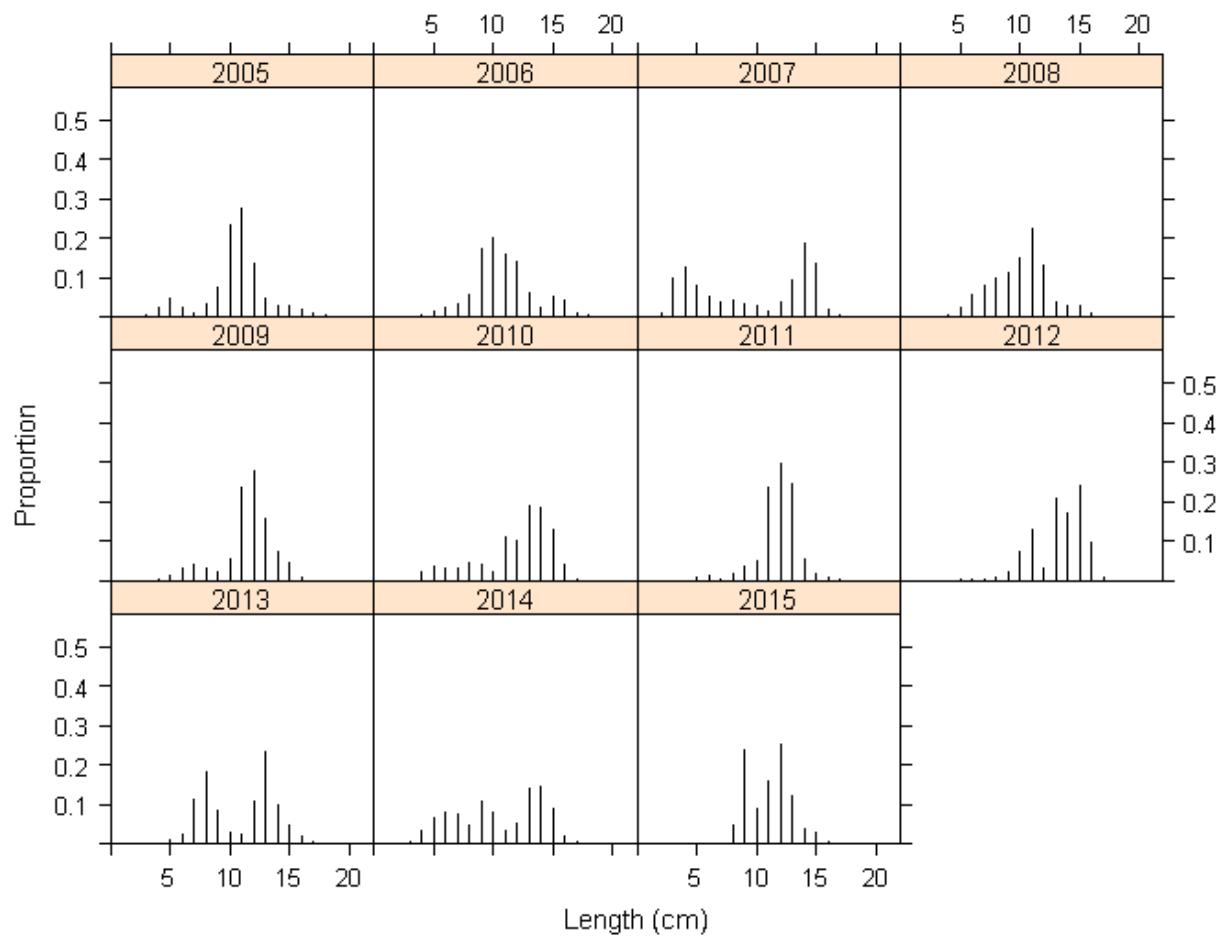

Figure 4 continued.

Appendix:
Distribution Maps

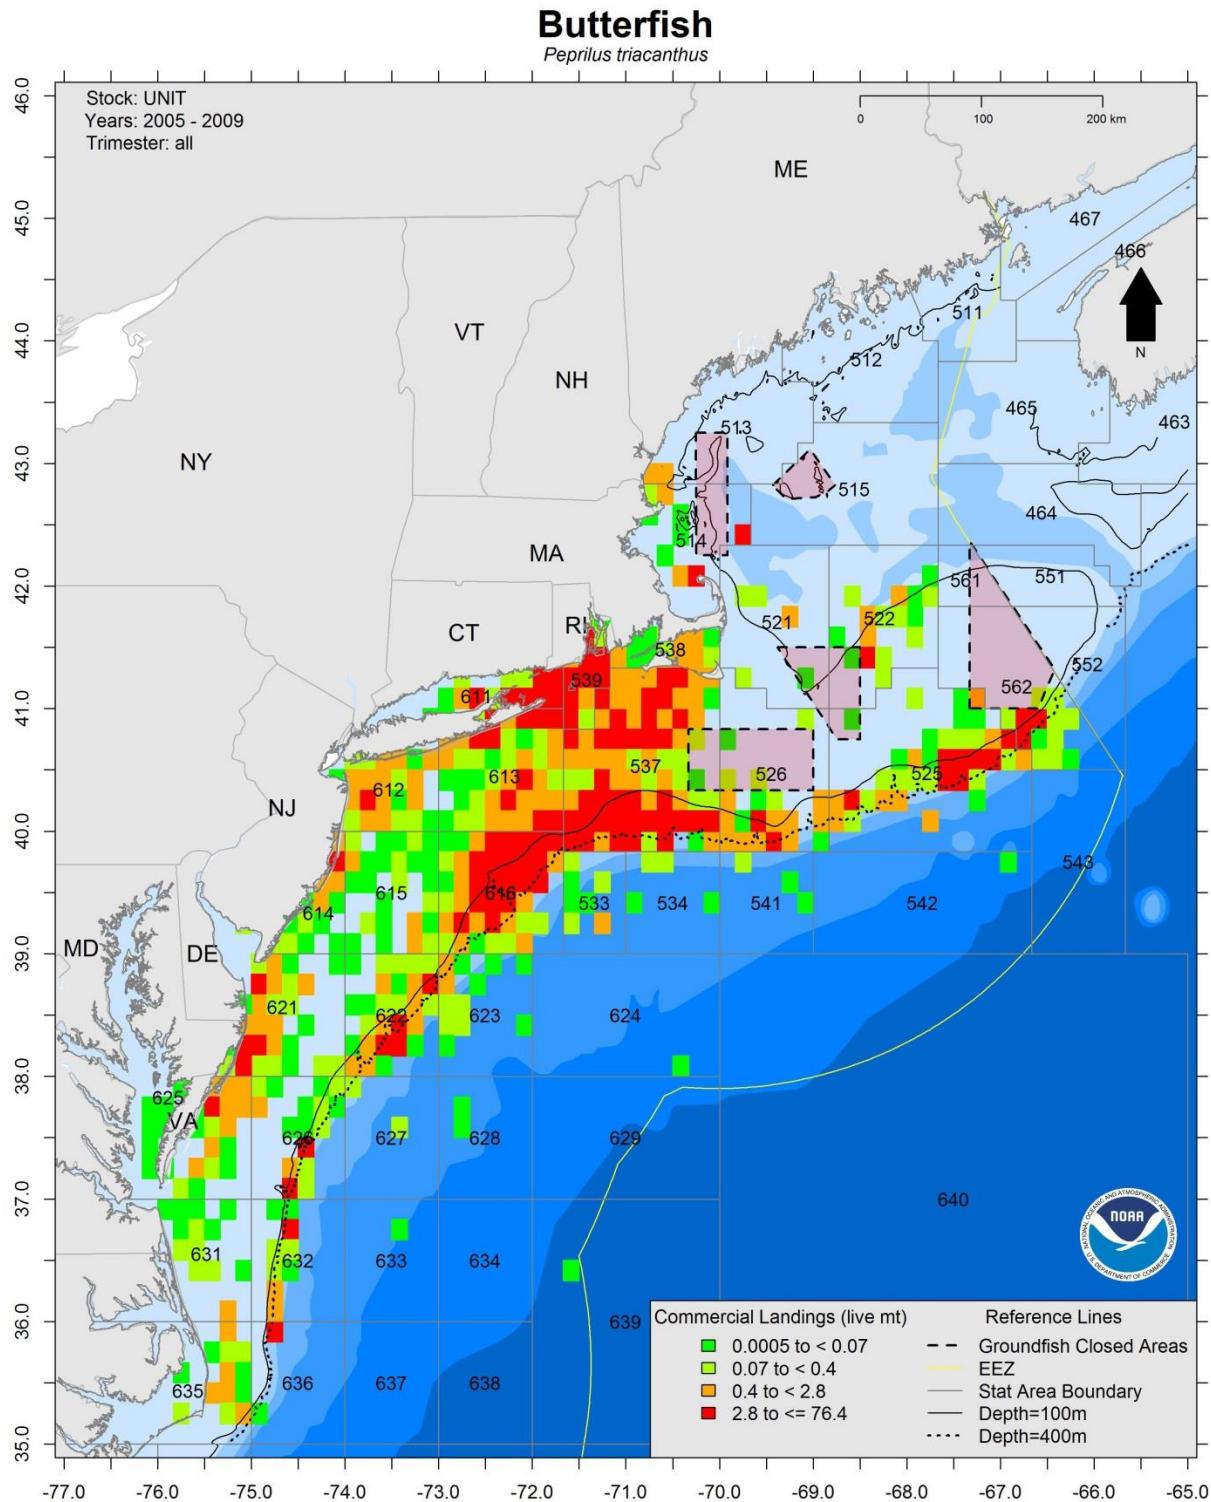

Figure A1. Commercial landings for butterfish, 2005–2009. Landings were taken from dealer reports. Data shown are restricted to dealer trips matched to a Vessel Trip Report (ALEVEL=A) to ensure accuracy of gear and area information. Total commercial landings reported: 2,555 mt. Commercial landings from trips with location data: 1,468 mt (57.5% of total).

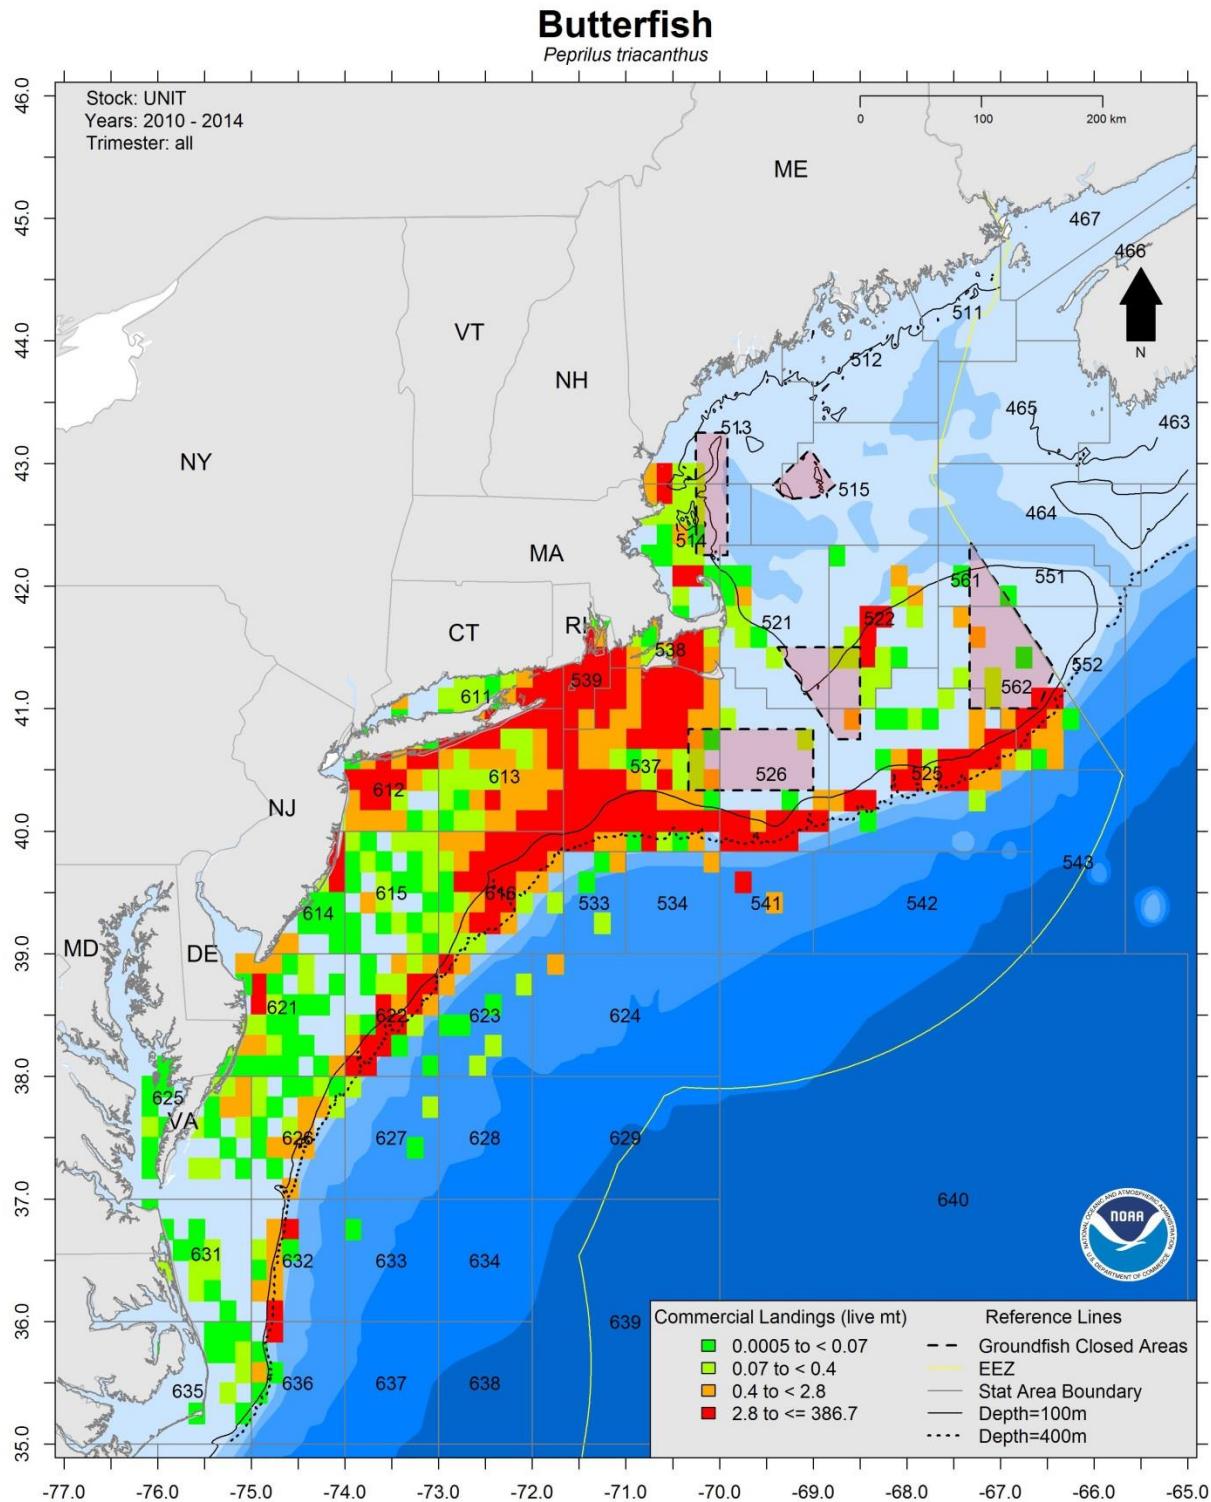

Figure A2. Commercial landings for butterfish, 2010–2014. Landings were taken from dealer reports. Data shown are restricted to dealer trips matched to a Vessel Trip Report (ALEVEL=A) to ensure accuracy of gear and area information. Total commercial landings reported: 6,105 mt. Commercial landings from trips with location data: 4,547 mt (74.5% of total).

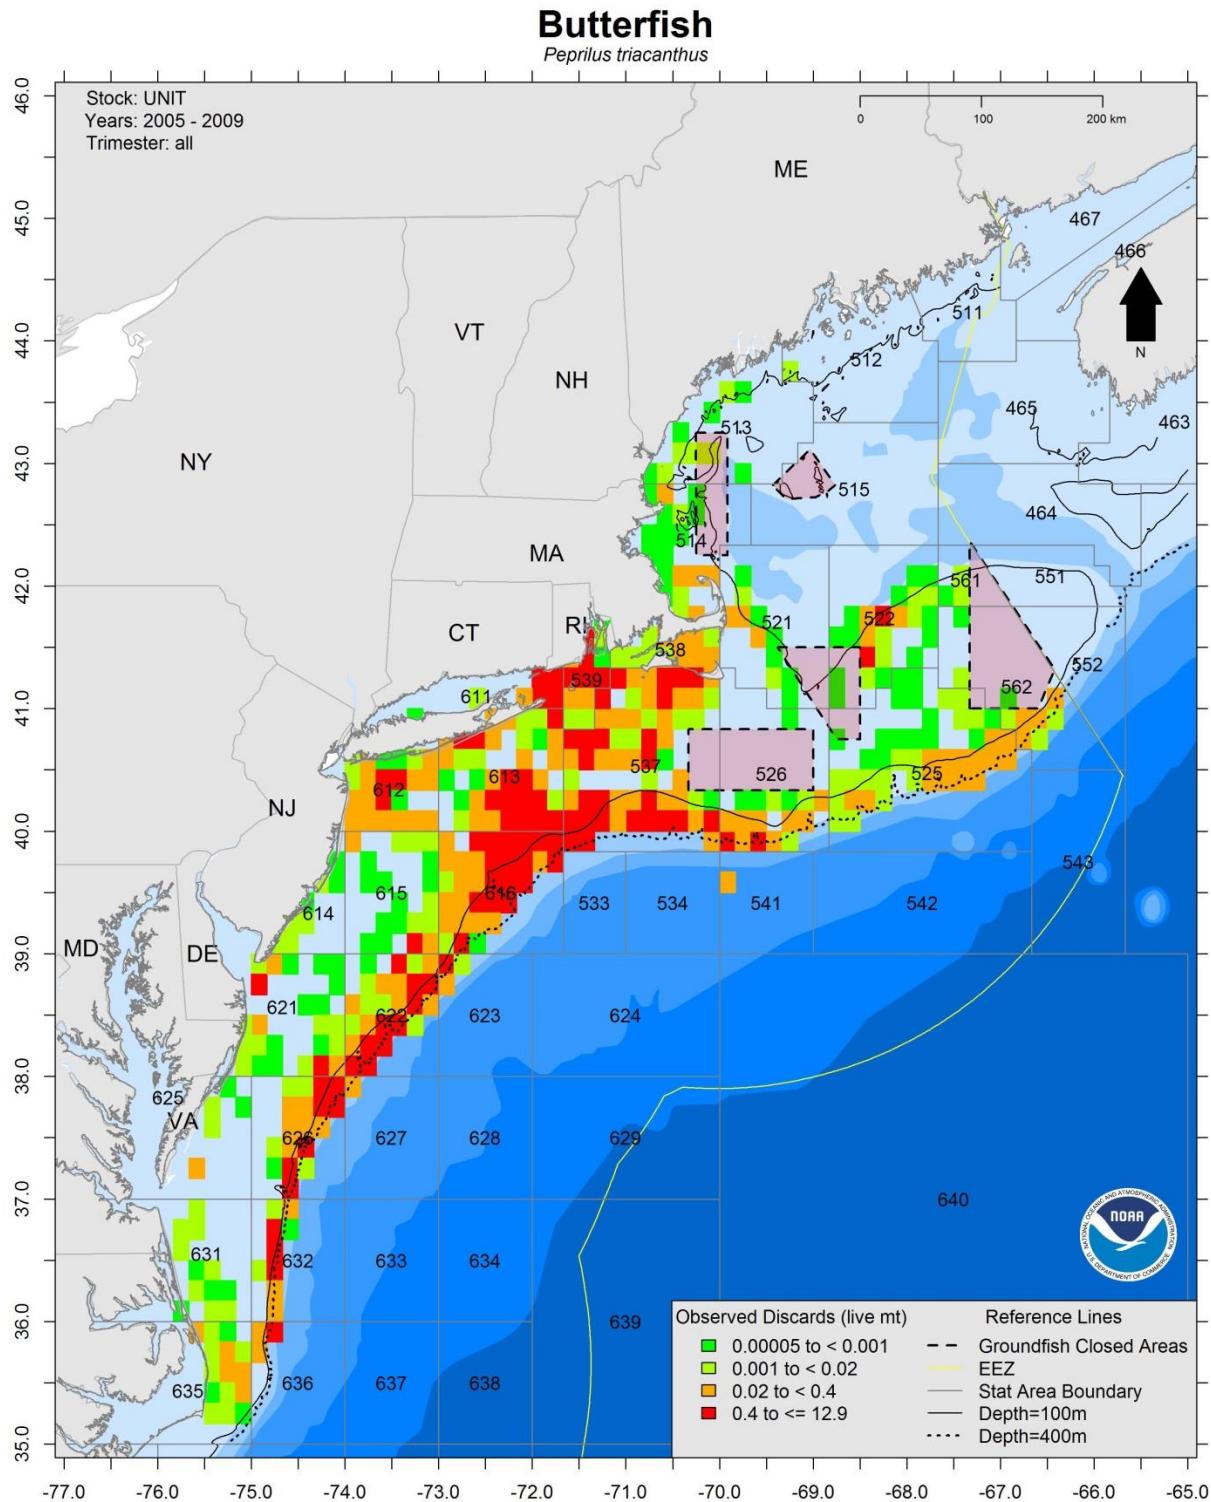

Figure A3. Observed discards for butterfish, 2005–2009. Discards were recorded by at-sea observers/monitors and reported via the Northeast Fisheries Observer Program database. Total observed discards reported: 224 mt. Observed discards from trips with location data: 224 mt (100.0% of total).

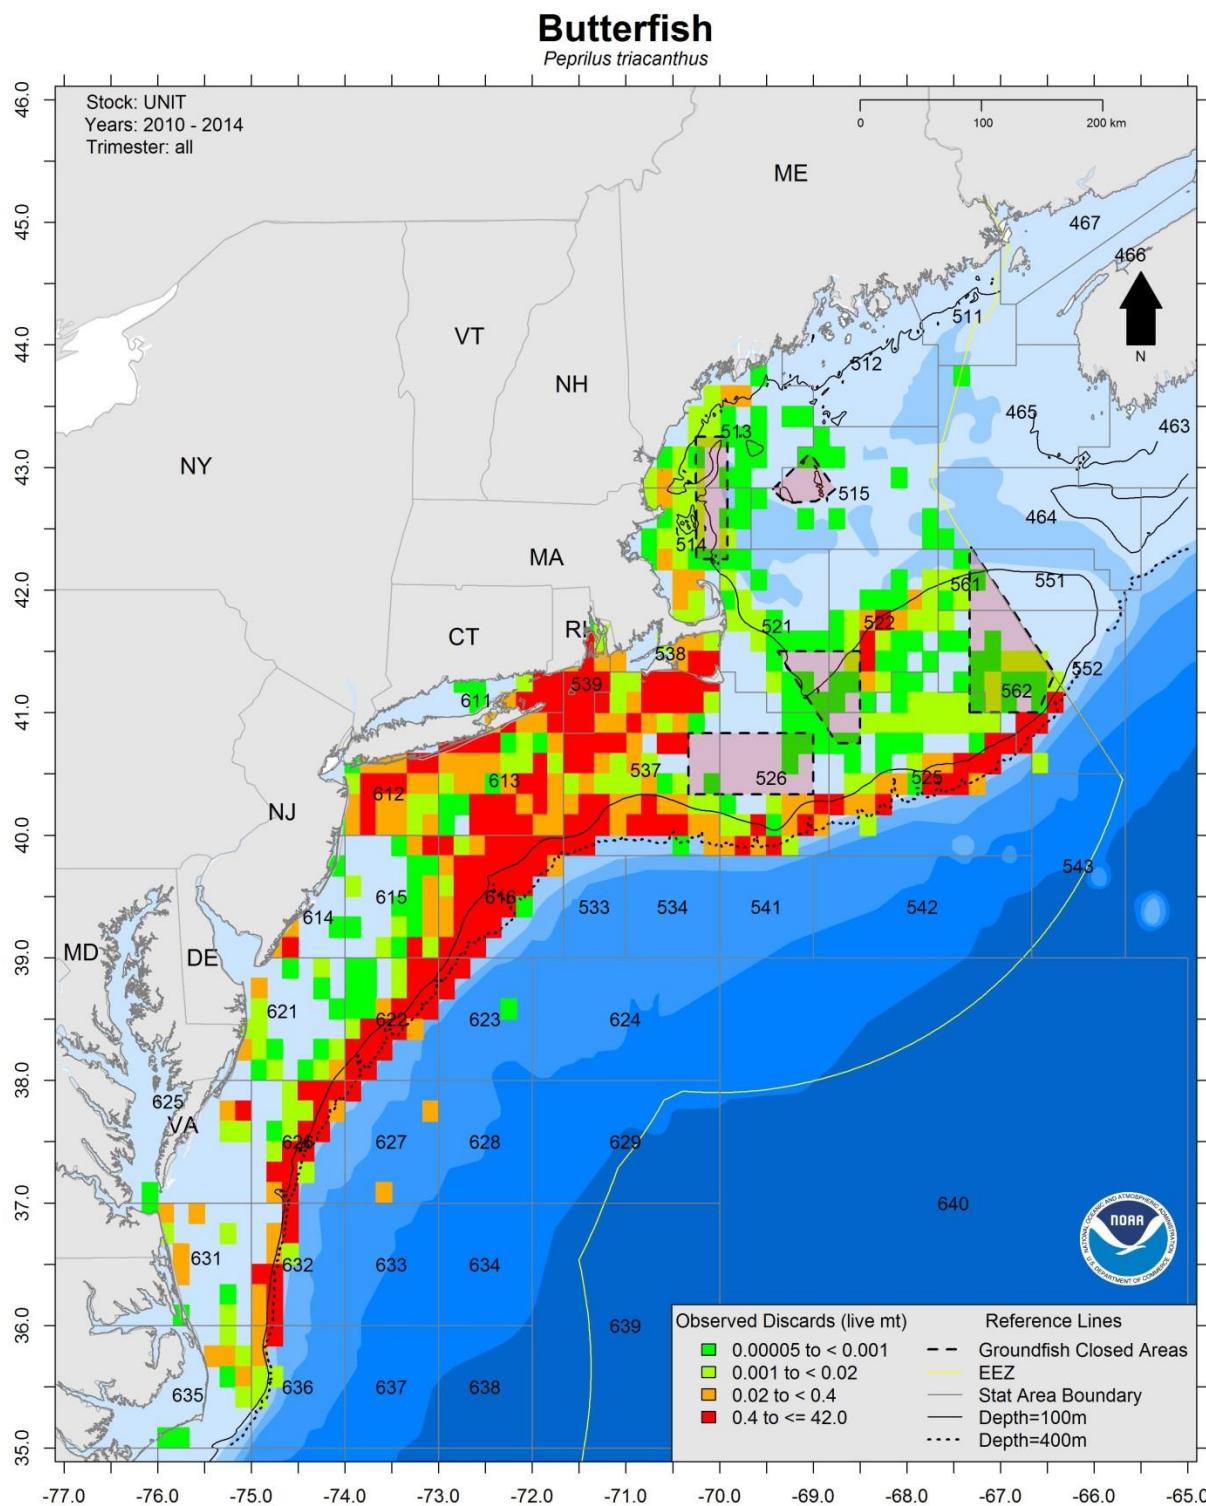

Figure A4. Observed discards for butterfish, 2010–2014. Discards were recorded by at-sea observers/monitors and reported via the Northeast Fisheries Observer Program database. Total observed discards reported: 598 mt. Observed discards from trips with location data: 598 mt (100.0% of total).

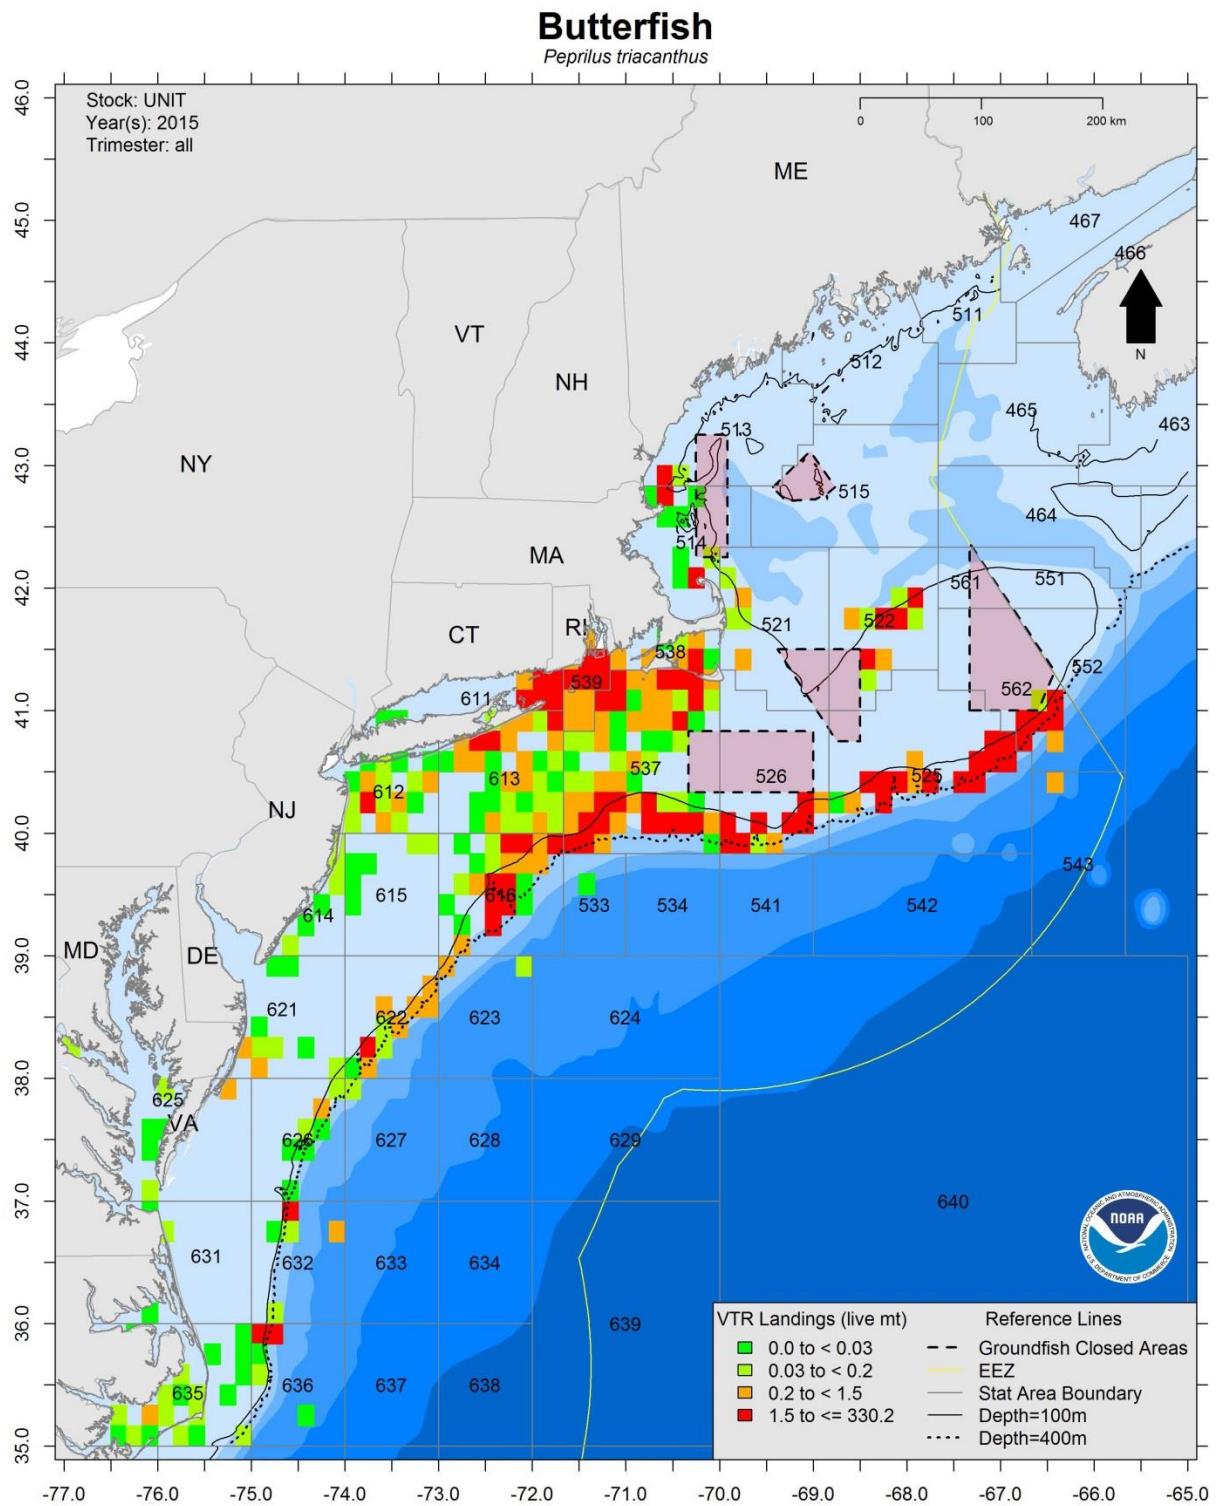

Figure A5. VTR landings for butterfish, 2015. Only data with valid locations are plotted. Total VTR landings reported: 1,943 mt. VTR Landings from trips with location data: 1,693 mt (87.1% of total)
